

The quiver that fits tight to your bow

For Immediate Release – The TightSpot™ quiver now features it's most durable and reliable quiver to date!

New for 2018 the TightSpot has a four fastener crossbar system that provides a much more stable platform that reduces vibration and allows for a more secure system on the structural carbon rods. The crossbar section between the rods has been beefed up by twice the thickness to make it more rigid and a much stronger platform without compromising weight.

TightSpot has also implemented a Delrin Saddle washer under the locking lever. This allows for a much smoother operation of the lever and a much more durable locking system. Over all the new TightSpot quiver is the most durable and reliable quiver they have ever made.

Also new this year is an optional secondary gripper for the 5 arrow quiver that can be attached to the carbon rods near the hood. This secondary gripper allows the user to secure their arrow in two places while the tip of the arrow is covered inside the hood but the blades do not touch anything.

Moving forward in the accessory line is the popular Treestand Bracket from last year. The bracket mounts to the back of the quiver on the carbon rods so it is always with the quiver. It comes off in a snap and screws to the tree where the quiver is then snapped into for a solid mount. No more fumbling around for a second arrow on a quiver that dangles around your stand. The brackets will be available for the 5 and 7 arrow models only.

The TightSpot quiver will also be available in more colors than ever before. Be sure to check the website for the latest update in color options.

All TightSpot models provide better bow balance, thanks to TightSpot's patented 3-way adjustment system that essentially allows your quiver to act as a stabilizer. They also kill vibration and noise five different ways and feature acoustic dampening material in the hood and vibration absorbing carbon rods. The quivers feature TightSpot's patented BullDog™ Arrow Grippers that are individually adjustable and offer 20 times the gripping power of other quivers.
